

## How to clone a repository

### **Method 1**

- Download the required files from BlueSky repo
- Create a new folder anywhere on your local computer
- Go to your Github account and create a new repo
- Clone that repository by going to the folder
- Right click anywhere on that folder, select git bash here
- When the git bash opens, press git clone and paste the link you copied from your GitHub repo and press enter
- That will clone the repo into your local drive
- Paste the files you downloaded earlier from BlueSky repo into that folder you created on your computer
- Right click anywhere in that folder and select git bash here
- Press git status (This will list the files you just copied into that folder)
- Press git add .
- Press git status (The files should now be green)
- Press git commit -am "Write your note" (The files should now be white because it has been committed)
- Press git push and press enter

(That will push the files to your remote repo)

### **Method 2**

- Log in to your GitHub
- Go to the repo you want to copy and copy the code
- Create a folder on your local computer
- Open that folder, right click anywhere and select git bash
- Press git clone and paste the code you copied
- Press enter
